

CRDTs

JavaScript Meetup Funchal

In distributed computing, a **conflict-free replicated data type (CRDT)** is a data structure which can be replicated across multiple computers in a network, where the replicas can be updated independently and concurrently without coordination between the replicas, and where it is always mathematically possible to resolve inconsistencies which might result.

Defined in 2011 by Marc Shapiro, Nuno Preguiça Carlos Baquero and Marek Zawirski.

In **distributed computing**, a **conflict-free replicated data type (CRDT)** is a **data structure** which can be **replicated** across multiple computers in a **network**, where the replicas can be updated independently and **concurrently** without **coordination** between the replicas, and where it is always mathematically possible to resolve inconsistencies which might result.

CRDTs

Is a Mathematical / CS Framework
that can be used to build many different types of
data structures, each having different characteristics.
